

Complex Fuzzy Decision Theory- Bays Fuzzy Decision Rule on no Data Problem

Houju Hori Jr.

Selected Chief in Hiyoshi Shrine into Mt. Hiei

Abstract

Hori (nee Uemura) and colleagues formalized decision-making methods in fuzzy events and probabilistic differential equations in fuzzy events and solved them to derive a Markov decision process in fuzzy events in a no data problem. This is Bays-Fuzzy Decision Rule which is developed by the Shinto's concept of evil as a unique technique in Japan with the soul of KIDO (in Japanese) based on the beliefs of nature God and having the heart of esoteric religion. For example, considering the mapping of the invisible world like a bill or a tile to a visible world, a mythical world composed of demon families (Prince Shotoku clan and Soga clan) It is a peculiar fuzzy theoretic subjective Bays theory unique to Japan constructed and positioned as a modern society of the Markov decision-making world map. Here, we will briefly describe the background of constructing Complex Fuzzy Decision Theory in this paper.

INTRODUCTION

Japan's Complex Fuzzy Decision Theory different from Zadeh's 's fuzzy sets theory is being built by Hori. based on the research thought of KIDO (Japanese original Shinto within nature before appearing our Emperor in Japan) represented by the Buddha teacher without a teacher signal, he focused on the demon which is peculiar religion in Japan and expresses the concept of the Shinto's evil as a mathematical model. The field to be handled is a complex field of fuzzy theory, applied probability theory and applied statistics, in particular, it covers the no data problem within or without big data. The no data problem is a problem with no likelihood regardless of the presence or absence of data, and it is a decision-making problem consisting solely of decision makers' subjectivity. The Complex Fuzzy Decision Theory that Hori built is also called analog image technology. At present, big data processing is being put to practical use, but the question is how far invisible world can be represented. Also, objective AI technology is suitable for building electronic manuals based on empirical rules We cannot deal with unexpected conditions (events) at all. When these adaptation limits for modern society become clearer, our subjective AI technology based on Complex Fuzzy Decision Theory will be necessary. Let's note that Akaike Bays will use the same data twice, in particular.

Conception of salvation in KIDO

An example of Hiei purification that was stained with rough blood was reported. Recently, the revival of the Prince Shotoku clan has also been done by deifying Japanese dragon God and Japanese Buddhist God living in Mt. Ikoma, Nara City, Japan. Decisions based on these KIDO are treated as schizophrenic patients in the world that they believe in the invisible world, but the believed only in the visible world, they are treated as schizophrenic patients. In particular, for the past several years I have been working at Nishihonganji Temple and working with a legal name, the legal name has been acknowledged by scholarly journals and books. This aim is to allow the country to recognize the legal name, that is, to allow the country to recognize "the other world". Here, our technique is based on the complex plane transformation (inverse transformation) formula that recognizes the existence of the soul.

Outline of Complex Fuzzy Decision Rule

This blurred event is thought to be the world that the eye can see. In addition, the illusion state seems to be caused by the subjective change of the decision maker like the real image and the virtual image of the convex lens and the

concave lens, and it is mathematically modeled by the Markovian transition of the blurred event. Here, this illusion state identification method is a Markov decision process in a fuzzy event (An example of a complex plane transform filter). Academically, it states the position in subjective Bays theory, extension of Wald's decision function and the difference between Zadeh's Type 2 fuzzy theory, and so on. For details, please search on PC or mobile at "Yoshiki Uemura", and "Houju Hori Jr."

Natural worship system Esoteric fuzzy theory

In Lingfeng Ikoma mountain belief, Ikoma mountain festival and Ikoma mountain dragon faith are mainstream. The main god of the Ikoma mountain saintly faith is the secret Buddha (joyous buddha) coming from India. If this secret Buddha is deified to a deity, it is the master and the princess of the large lord of the Miwa mountain crown, and in the case of Buddha it is a true belief in religion of Prince Shotoku and wife of Ikaruga no Sato. Also, Jizo Bodhisattva faith is deeply rooted, and Shingon Buddhism mountain temple has Magdalen. This Jizo Bodhisattva faith is Sosaka incense of Asuka no Sato and faith to her wife. In other words, simply, it is thought that this world, the other world and the world after death are controlled by the emperor, but since the Ikoma mountain priest faith is mainly aimed at world peace and ancestor retirement, natural person himself (From the viewpoint that the mountain) is a god (emperor), there is no exaggeration to say that it is a mysterious Bayesian thought.

Complex Fuzzy Decision Theory performs formulation of stochastic differential equations and derivation of solutions in decision-making problems after derivation and transformation (inverse transformation) of complex plane transformation (inverse transformation) formulas, in particular, We showed that our Complex Fuzzy Decision Theory can be applied. In the no data problem, suicide bombings and special attack units in pre-war Japan are examples, there are still worlds that recognize suicide bombing in the no data area, so for example, our complex decision-making method can be applied. It is possible to develop a subjective AI part of a decisive unmanned human torpedo celestial of an example of a shogi's fly (Dragon King).

We consider that the other world is a world mapped and transformed from this world (complex plane) by transferring the state of nature to the fuzzy events, and its decision making method is a Markov decision process which solved probabilistic differential equations in the no data problem. As a series of applications, we have devised an illusion state identification method in the no data problem.

Complex Fuzzy Decision Theory can apply to the high risk-high return problem in which the decision maker is the risk lover type, using the max-product method. Finally, the future task is to derive a two-dimensional complex plane transformation (inverse transformation) formula that also considers the spiritual world in Shingon Esoteric Buddhism. This decision rule is based on "Type 2 Bays-Fuzzy Decision Theory with the reserved judgement into the indifferent zone", where my paper will soon appear, because I had already obtained my formula in that decision rule from my speech paper in IIZUKA-90. My study/ research concept and my strong belief is that my formulating Complex Fuzzy Decision Theory based on Bays-Fuzzy Decision Rule in no Data Problem can cover Japanese original decision making based on KIDO, which had applied to the last war as Japanese researching airplane with no reader computer for the attacking ship on the sea. Therefore, this problem is under no data problem with/without big data. At some day, I should have to formulate this Japanese original decision making based on KIDO as this Japanese researching airplane.
